ARGUS

SOLUTION SHEET · SAFETY

Person Down & Activity

Know when someone falls, and what everyone was doing.

Real output from Argus: 17 body points on every tracked person, about once a second.

THE PROBLEM

A worker collapses in an empty aisle, a guest slips on the stairs at night. Cameras see it, but nobody is watching that screen, and finding it later means hours of scrubbing.

WHAT IT DOES

Argus reads the body of every person it tracks: standing, sitting, crouching or lying, hands up or down, and the colour of their top and trousers. It alerts you when someone stays down, and remembers the rest so you can ask about it later.

HOW IT WORKS

1. **Track** Each person gets an ID and is followed.
2. **Read the body** 17 points: head, shoulders, elbows, wrists, hips, knees, ankles.
3. **Remember** Posture, hands and colours are stored whenever they change.
4. **Alert or answer** Someone down for 10 s is an alert; any question later gets an exact answer.

WHAT YOU GET

Person down
Alert when someone stays lying for 10 seconds, with a snapshot.

Hands up
Both hands held above the head for 3 seconds, at a till or a desk.

Posture history
Seconds standing, sitting or lying, per person and per visit.

What they wore
Main colour of the top and of the trousers, from 11 colour names.

Ask in plain words
"Did anyone fall in the warehouse last night?" "A red top and blue jeans?"

Stays on site
Runs on your own server, on CPU. No face recognition needed.

WHERE IT'S USED

Warehouses · Lone and night workers · Care homes · Stairs and car parks · Retail tills · Construction sites

Good to know

People need to be at least 80 pixels tall in the picture. Colours are lost at night on infrared cameras. Argus is an extra pair of eyes, not a medical alarm: we test person-down on staged falls at your site, and agree the false-alarm level with you, before it goes live.

Try it on your own cameras

Start with a short pilot on a few cameras at your site.
