SOLUTION SHEET · SAFETY

Fire & Smoke Detection

See smoke on camera, before the alarm goes off.

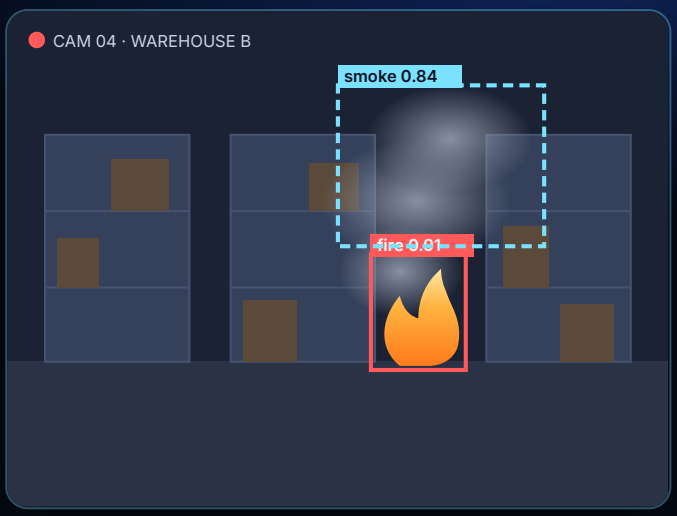

Illustration of an alert: flames and smoke found and marked on a warehouse camera.

THE PROBLEM

Ceiling smoke detectors only react once smoke reaches them. Under high warehouse roofs or in open yards that can take minutes, or never happen at all.

WHAT IT DOES

The system looks for flames and smoke in your camera views and sends an alert with a snapshot, so your team can check and act straight away.

HOW IT WORKS

1. **Watch** Every camera, day and night.
2. **Spot** AI finds flame and smoke regions.
3. **Confirm** Seen over several frames, not a single flash.
4. **Alert** Snapshot to your team in seconds.

WHAT YOU GET

Flames and smoke
Detects both, so you get warned in the early smoky stage too.

Snapshot with every alert
See what the camera saw and decide fast.

Fewer false alarms
An alert needs the detection to hold over several frames.

Covers open spaces
Yards, high roofs and car parks where detectors struggle.

Uses your cameras
No new sensors to install on the ceiling.

Works with your alarm
An extra early warning, not a replacement for certified systems.

WHERE IT'S USED

Warehouses · Factories · Parking garages · Recycling and waste yards · Farms and forest edges · Fuel and gas depots

Good to know

Steam, fog and dust can look like smoke, and very thin smoke is harder to see. We set thresholds on your own site during the pilot. This is an early-warning layer that works alongside your certified fire alarm.

Try it on your own cameras

Start with a short pilot on a few cameras at your site.
