// PRODUCT OVERVIEW

Ask your cameras what happened.

Argus keeps a searchable memory of what your cameras see, so you can ask about it later in plain language and get answers that point to the frames.

Argus, after Argus Panoptes: the all-seeing, hundred-eyed watchman of Greek myth.

THE PROBLEM

Cameras record everything. Finding one moment still means scrubbing through hours of video.

Most footage is only opened after something has gone wrong. A recorder lets you jump to a time, not to a moment, and alerts only react to rules set in advance. The question you have today was usually not one of them.

WHAT YOU CAN ASK

Questions you would ask a colleague

EXACT COUNT
How many cars came in today?

EXACT LIST
What happened yesterday from 6pm to 9pm?

EXACT, TOGETHER
Anyone with a dog this morning?

CLOSEST MATCHES
Was there a white van at the gate yesterday evening?

HOW IT WORKS

Record, ask, answer

01
Record
Every object is detected, tracked and stored as searchable memory, across 80 everyday object types. Every few seconds the whole scene is stored too, so things without a label stay findable.

02
Ask
Your question is split into what, when and which camera. Time can be plain words: “yesterday evening”, “last 2 hours”, “last Friday”.

03
Answer
Argus replies in sentences, what it found, when and where, and lists the frames it checked so you can see for yourself.

ANSWERS YOU CAN TRUST

Counted when it can be. Described when it can't.

Counted: exact

What, when and how many come straight from the detector and tracker. Counts are visits: each arrival is counted.

Described: closest matches

Descriptions like "white van" or "red jacket" are matched against what the cameras saw. Argus shows the closest matches with their frames, so you can confirm at a glance.

PRIVATE BY DESIGN

Your footage stays in the building

- **Runs on your own server.** Cameras stay on your network.
- **The language model runs locally by default.** Nothing leaves the site.
- **One memory per site, on your machine.** You set how long it is kept: 30 days by default.
- **Face recognition is off** unless you approve it.

Local · default

Runs on the server's CPU. Nothing leaves the site.

Local, larger

Better answers with about 20 GB of RAM or a GPU. Still on site.

Cloud · only if you opt in

Sends the question and text search results. Never images or video.

ON SITE

Your cameras, one server, no GPU required

Argus works with standard IP cameras. It analyses each camera's light stream and can record the full-quality stream untouched, so search results come with sharp crops. On busy scenes it samples more sparsely rather than falling behind.

~55 ms
to describe one object on a laptop CPU

2 KB
search vector per sighting, plus a small thumbnail

80
object types, plus the whole scene every few seconds

0
frames of video sent off site

ALERTS WHEN IT MATTERS

Tell me when it happens

01

Areas and lines

Draw areas and lines on each camera. An alert fires when something enters, leaves, stays too long or crosses a line.

02

Your objects, your rules

Each rule picks what it watches: only people in the yard, only trucks at the gate. Every site gets its own rules.

03

Sent where you need it

By email or straight into your own systems, with a snapshot of the moment. Repeats are held back, so nobody gets flooded.

Next: detectors trained for each customer's needs, such as fire and smoke, and alerts from a description ("a white van at the gate").

WHERE IT FITS

Any site with cameras and questions

Gates and car parks

"How many trucks came in this morning?"

Warehouses and yards

"Was anyone at the loading bay camera yesterday evening?"

Campuses and public spaces

"When did a bag first appear by the bench?"

Construction sites

"Was there a white van at the gate yesterday evening?"

WHERE ARGUS IS TODAY

Working now, and what comes next

Working now

- Recording and indexing per camera
- Plain-language questions by time, object type and camera
- Chat with a choice of local or cloud models
- Answers that list their evidence frames
- Alerts by area and line, by email or into your systems

Next

- A fixed test set on recorded footage to compare models
- Scene captions for "what was he doing" questions
- Following one visit across several cameras
- Detectors trained per customer, such as fire and smoke
- Alerts from a description

See it on your own footage

We set Argus up on a sample of your recorded video, you ask it your questions, and then you decide.
